Submitted (APR-2000) to the EMBL/GenBank/DDBJ databases.

Submitted (APR-2000) to the beta-catenin canonical signaling pathway, which are coupled to the beta-catenin canonical signaling pathway, which leads to the activation of dishvelled proteins, inhibition of GSK-3 kinase, nuclear accumulation of beta-catenin and activation of wht target genes. A second signaling pathway involving PKC and calcium fluxes has been seen for some family members, but it is not yet clear if it represents a distinct pathway or if it can be integrated in the canonical pathway, as PKC seems to be required for Wnt-mediated inactivation of GSK-3 kinase. Both pathways seem to involve interactions with G-proteins. May be involved in transduction and intercellular transmission of polarity information during tissue morphogenesis and/or in differentiated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          TISSUE SPECIFICITY: Most abundant in fetal kidney, followed by brain and lung. In adult tissues, expressed in kidney, heart, pancreas and skeletal muscle.

DOMAIN: Lys-Thr-X-X-X-Trp motif is involved in the activation of the Wnt/Deta-catenin signaling pathway (By similarity).

DOMAIN: The fz domain is involved in binding with Wnt ligands (by

Identification, characterization, and localization to chromosome

I 7421-22 of the human TBX2 homolog, member of a conserved

developmental gene family.";

Mamm. Genome 6:793-797(1955).

-1- FUNCTION: INVOLVED IN THE TRANSCRIPTIONAL REGULATION OF GENES

REQUIRED FOR MESODERM DIFFERENTIATION. PROBABLY PLAYS A ROLE IN

LIMB PATTERN FORMATION.

-1- SUBCELLULAR LOCATION: Nuclear (Potential).

-1- TISSUE SPECIFICITY: EXPRESSED PRIMARILY IN ADULT IN KIDNEY, LUNG,

AND PLACEMTA. WEAK EXPRESSION IN HEART AND OVARY.

-1- SIMILARITY: CONTAINS 1 T-BOX DOMAIN.
                                                                                                                                                                                                                                                                                                                                                                 TISSUE-Fetal kidney;

"AGOI defines a novel locus of Arabidopsis controlling leaf
Eukaryota; Viridiplantae; Streptophyta; Embryophyta; Tracheophyta;
Spermatophyta; Magnoliophyta; eudicotyledons; core eudicots; Rosidae;
eurosids II; Brassicales; Brassicaceae; Arabidopsis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Nature 408:816-820(2000).

-i - FUNCTION: ESSENTIAL FOR PROPER DEVELOPMENT OF LEAVES AND FLORAL ORGARD.

-i - SUBCELLULAR LOCATION OF AXILLARY MERISTEMS.

-i - SUBCELLULAR LOCATION: CYTOPLASMIC (POTENTIAL).

-i - TISSUE SPECIFICITY: WIDELY EXPRESSED AT LOW LEVELS.

-i - DEVELOPMENTAL STAGE: EXPRESSED THROUGHOUT ALL DEVELOPMENTAL
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 .;

```

```
-1- SUBBNIT: THE PACE4A-I PRECURSOR PROTEIN SEEMS TO EXIST IN THE RETICULUM ENDOPLASMIC AS BOTH A MONOMER AND A DIMER-SIZED COMPLEX WHEREAS MATURE PACE4A-I ENSISTS ONLY AS A MONOMER, SUGGESTING THAT PROPERTIES CLEAVAGE AFFECTS ITS TERRITARY OR QUATERNARY STRUCTURE.
-1- SUBCELLULAR LOCATION: PACE4A-I AND PACE4-AIL ARE SECRETED. PACE4CA AND PACE4CS ARE NOT SECRETED AND REMAIN PROBABLY IN ZYMOGEN FORM IN ENDOPLASMIC RETICULUM. PACE4E-I AND PACE4E-II ARE RETAINED INTRACELLULARIX PROBABLY THROUGH A HYDROPHOBIC CLUSTER IN THEIR C-
```

TERMINUS. PACCAGE MIGHT BE SECRETED.

--- ALTERNATUS. PACCAGE MIGHT BE SECRETED.

--- ALTERNATUS PRODUCTS: 8 ISOFORMS; PACCAG-I/PACCA (SHOWN HERE),

PACCAG-II, PACCAGE PACCA I, PACCAG', PACCAG'S, PACCAD.

--- PACCAG-II, PACCAGE BY ALTERNATUSE SPLICING. ISOFORMS PACCAGE.

C, CS AND D MIGHT BE ENZYMATICALLY INACTIVE.

--- TISSUE SPECIFICITY: EACH PACCA ISOFORM EXHIBITS A UNIQUE

RESTRACTED DISTRIBUTION. PACCAGA ISOFORM EXHIBITS A UNIQUE

RESTRACTED DISTRIBUTION. PACCAGE ISOFORM EXHIBITS A LEAST

COMPARATIVELY HIGHER LEVELS IN THE LIVER. PACCAGA-II IS AND EACH

KIDNEY CELL LINE FROM WHICH IT WAS ISOLATED. PACCAC AND PACCAGE ARE

EXPRESSED IN PLACETHY PACCAGE. IS EXPRESSED IN CEREBELLUM,

PLACEMYA AND PITUITARY. PACCAGE-II IS AT LEAST

PLACEMYA AND PITUITARY. PACCAGE-II IS AT LEAST PRESENT IN

-i- DOMAIN: THE PROPEPTIDE DOMAIN ACTS AS AN INTRAMOLECULAR CHAPERONE ASSISTIN: THE FOLDING OF THE ZYMOGEN WITHIN THE ENDOPLASMIC RETICULUM. ISOFORM PACE4D LACKS THE PROPEPTIDE DOMAIN.
-i- SIMILARITY: BELONGS TO PEPTIDASE FAMILY S8; ALSO KNOWN AS THE SUBTILASE FAMILY CEREBELLUM.

-! - SIMILARITY: CONTAINS 1 HOMO B/P DOMAIN.
